July 13, 2015

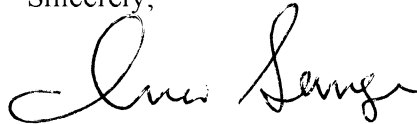

Executive Director and Secretary  
Washington Utilities and Transportation Commission  
P.O. Box 47250  
1300 S. Evergreen Park Drive, S.W.  
Olympia, Washington 98504-7250.

Re: Washington Utilities and Transportation Commission v. PacifiCorp, dba Pacific Power &  
Light Co.  
Docket No. UE-144160

Dear Mr. King:

Please find one copy of the Declaration of John Lowe in the above captioned docket. Pursuant to the Prehearing Conference Order, electronic copies of the Declaration will be filed with the records center and served upon the parties. Electronic copies of the Declaration will be provided in Word and pdf format, and the Attachment will be provided in pdf format only.

Sincerely,

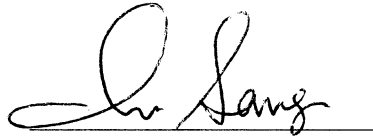

Irion A. Sanger

cc: Service List (via email)

**CERTIFICATE OF SERVICE**

I hereby certify that I have caused to be served the following DECLARATION OF JOHN LOWE in WUTC Docket No. UE-144160 by electronic mail to the parties on the attached service list.

DATED July 13, 2015

Irion A. Sanger

**BEFORE THE WASHINGTON  
UTILITIES AND TRANSPORTATION COMMISSION**

WASHINGTON UTILITIES AND TRANSPORTATION COMMISSION,	)	<b>DOCKET NO. UE-144160</b>
	)	
Complainant,	)	
	)	<b>DECLARATION OF JOHN R. LOWE</b>
v.	)	
	)	
PACIFICORP D/B/A PACIFIC POWER & LIGHT COMPANY,	)	
	)	
Respondent.	)	

---

John R. Lowe declares:

1. My name is John R. Lowe. I am the Executive Director of the Renewable Energy Coalition (“REC”). My business address is 12050 SW Tremont Street, Portland, Oregon 97225.
2. I am over the age of twenty-one, have personal knowledge of the facts set forth herein, and am competent to testify to those facts.
3. The purpose of this declaration is to oppose Pacific Power & Light Company’s (“PacifiCorp”)<sup>1</sup> Schedule 37 avoided cost update that was filed in this proceeding on December 29, 2014. REC recommends that the Washington Utilities and Transportation Commission (the “Commission”) retain Schedule 37’s current rate design with a monthly kilowatt (“kW”) capacity payment, and a megawatt hour (“MWh”) energy charge. REC also recommends that the Commission increase the monthly kW

---

<sup>1</sup> This declaration refers to Pacific Power & Light Co. as PacifiCorp for the sake of convenience because I discuss both the company’s Washington operations (which are under the name Pacific Power & Light Co.), and the company’s other operations (which are under the name PacifiCorp, or sometimes Rocky Mountain Power).

capacity payment, and/or MWh energy charge because they under compensate Washington qualifying facilities (“QF”) for the capacity and energy they provide to PacifiCorp.

### **Background**

4. REC was established in 2009, and is comprised of over thirty members who own and operate nearly forty non-intermittent QFs in Oregon, Idaho, Washington, Utah, and Wyoming. REC’s members have power purchase agreements with Northwest utilities, including PacifiCorp. Yakima-Tieton Irrigation District has been a Coalition member since 2011, and sells its power to PacifiCorp from two about 1.5 MW hydroelectric projects (the Orchard and Cowiche projects). These facilities have been operating since 1986, and have been a consistent reliable source of generation even in drought years due to their senior water rights. As an irrigation district, the power sales for these facilities are reinvested into the community, and providing significant benefits to the local economy.

5. REC actively participates in utility rate proceedings and investigations in the Northwest regarding power purchase agreement terms and conditions including avoided cost prices, integrated resource planning, interconnection, and other matters relevant to QFs and independent power producers. REC also monitors and lobbies legislatures on energy policy matters. In addition, REC provides consulting services to individual members on contractual, operational, interconnection, and other issues related to their electric generation facilities and the interface with the purchasing utility.

6. PacifiCorp has 141 existing QFs representing 1,732 MW of installed capacity in all six of its state jurisdictions.

7. In contrast, PacifiCorp currently has only three Washington QFs selling power to the company. These are the Yakima-Tieton Irrigation District's Orchard and Cowiche projects, and Deruyter Dairy's 1.2 MW methane facility. The Deruyter Dairy methane facility is the only Washington QF that has been built in and currently selling power to PacifiCorp since 1990. To my knowledge, the only other QF to have sold to PacifiCorp since 1990 in Washington was the City of Walla Walla. The City has since decided to terminate sales to PacifiCorp after the original purchase power agreement expired and the prices dramatically dropped in accordance with recent Schedule 37 prices. The total MWs of all three operating projects selling power to PacifiCorp in Washington is about 4 MWs, which represents less than 0.3% of all PacifiCorp's MWs of QF contracts.

8. In its other states, PacifiCorp has 816 MW of newly executed wind and solar qualifying facility power purchase agreements from 36 projects having in-service dates by the end of 2016. PacifiCorp 2015 Integrated Resource Plan ("IRP") at 4. As of March 2015, PacifiCorp had about 89 requests for new QF contracts in its other states, all but two of which are wind and solar.

9. In my experience based upon 35-years plus of implementing the Public Utility Regulatory Policies Act ("PURPA") in the Northwest, it is highly unlikely that all requests for new contracts or even all QFs that sign contracts with the utility will result in a constructed QF that sells electricity to the utility. In other words, many QFs request contracts or enter into contracts, but are unable to complete financing and construction of their facility. Regardless, the requests for contracts and the number of new contracts in PacifiCorp's non-Washington service territory are significant.

10. PacifiCorp has zero newly executed QF power purchase agreements in Washington. PacifiCorp has no interconnection or power purchase agreement requests from any QFs in Washington. It is significant that there are no requests for contracts or new contracts in Washington, especially given the requests and new contracts in other states.

11. The numbers of PacifiCorp's Washington QFs and MWs has been and continues to be significantly lower than PacifiCorp's other states. This indicates that PacifiCorp's Washington implementation of the Public Utility Regulatory Policies Act has not been, and is currently not, favorable to the development of QFs. Favorable contract terms, including length of contract and prices, are necessary to encourage the development of QFs. Washington has a number of significant untapped renewable energy resources that could be developed to benefit utility customers and the local economy with proper implementation of PURPA. The need for expansion of the Washington renewable portfolio standard, compliance with the Environmental Protection Agencies ("EPA") Section 111(d) rules or other regulator requirements could also be reduced with the development and retention of cost effective QFs.

### **PacifiCorp Schedule 37**

12. PacifiCorp purchases power from QFs two MWs or smaller in Washington pursuant to its Schedule 37 Cogeneration and Small Power Production rate schedule. QFs above 2 MWs must negotiate contracts with PacifiCorp. No QFs larger than 2 MWs have been built in Washington and sold their power to PacifiCorp. All of PacifiCorp's other states have larger QFs, and every state but Washington has at least one QF 20 MWs or larger. Even the recently built 15 MW Tieton Dam project in

PacifiCorp's service territory northwest of Yakima had to sell its output out of state. The fact that PacifiCorp's avoided cost rates and contract terms were less favorable than transmitting the power out of state is illustrative of the problems facing local energy developers in PacifiCorp's Washington service territory.

13. Avoided cost rates under Schedule 37 include capacity and energy payments. The capacity payment is based on a fixed dollar per kW month rate. Under the currently effective Schedule 37, the fixed dollar per kW month capacity rates for the five-year period of 2015-2019 start at \$2.49 and rise to \$2.66. The energy payment is a fixed dollar per MW hour rate. Under the currently effective Schedule 37, the fixed dollar per MW hour energy rates for the five-year period of 2015-2019 start at \$31.92 and rise to \$40.22.

14. Fixed energy and capacity rates are only available to QFs for the first five years of any contract.

15. PacifiCorp's avoided cost rates in Schedule 37 are significantly lower than the avoided cost rates for Puget Sound Energy ("PSE") and Avista. Also, PacifiCorp files Schedule 37 in all other states except California, and the rates and/or terms are more favorable in all of those states compared to Washington. This indicates that PacifiCorp's avoided cost rates and/or terms need improvement rather than further degradation in the form of eliminating capacity payments

#### **PacifiCorp's Proposed Revision to Schedule 37 Avoided Cost Rates**

16. PacifiCorp has proposed to eliminate the dollar per kW month capacity rate.

17. PacifiCorp supports its proposal because its 2013 integrated resource plan (“IRP”) Update indicates that its next major thermal resource will be acquired in 2027. PacifiCorp claims that QFs will not cause the company to avoid capacity costs because the company may not need to acquire a new thermal resource until 2027.

18. Prior to 2027, PacifiCorp has a significant energy and capacity resource need. In this proceeding, PacifiCorp states that it will rely upon market purchases, or front office transactions for both its energy and capacity needs. PacifiCorp proposes that Schedule 37 only include the company’s estimates of the market purchase prices. The value of these market purchases would be estimated using PacifiCorp’s Generation and Regulation Initiative Decision computer model.

19. PacifiCorp has proposed an alternative rate design. PacifiCorp proposes to differentiate the fixed dollar per MWh energy rate into a heavy load hour and a light load hour rate. This does not change the effective value of sales from consistent 24-7 producer like Yakima-Tieton’s irrigation system hydro projects, but could change the compensation paid to wind and solar projects.

#### **Renewable Energy Coalition Proposed Schedule 37 Avoided Cost Rates**

20. REC recommends that the kW month capacity rate should at a minimum be retained because QFs are providing the company with capacity. REC further recommends that the: 1) the dollar per kW month capacity rate be increased to better reflect the capacity resources the company plans to acquire; and/or 2) the dollar per kWh energy rate be increased because it does not accurately reflect expected energy costs.

**A. The Commission Should Retain a kW Month Capacity Rate**

21. PacifiCorp needs both energy and capacity that can be avoided by QF purchases. In its 2015 IRP, PacifiCorp plans to meet its energy and capacity needs over its twenty-year planning horizon with short-term market purchases, demand side management, coal plant conversions, and almost 3,000 MWs of new natural gas facilities. PacifiCorp is also planning on significant investments in its existing coal fleet to maintain its existing energy and capacity resources that will be made before the acquisition of its next thermal resource. QFs that sell power to PacifiCorp will help the company avoid its need for these energy and capacity resources, including coal plant investments and new gas generation facilities.

22. PacifiCorp's IRP plans on acquiring a new combined cycle combustion turbine in 2027 or 2028 (2013 IRP Update and 2015 IRP). PacifiCorp's planned resource acquisitions have historically been inaccurate, especially during the longer-term. For example, in 2008 PacifiCorp did not "plan" on acquiring a new thermal resource until 2012. However, PacifiCorp acquired the 520 MW Chehalis plant in 2008. PacifiCorp's resource needs identified in its current IRPs may be even more inaccurate. PacifiCorp's actual resource acquisitions could significant change if its IRP assumptions prove inaccurate, including but not limited to: 1) changes in Washington's RPS; 2) PacifiCorp joining the California Independent System Operator; 3) the adoption of a federal RPS; 4) adoption of a state or federal carbon tax; 5) the adoption of EPA's Section 111(d) rules; 6) closure of part or all of the Colstrip or other coal generation facilities; 7) the inability to capture the high levels of demand side management; and 8) the lack of availability of power in the wholesale market. All of these policies could result in a reduction in coal

generation, and an increase in renewables, baseload gas, and peaking gas generation well before 2027.

23. In the past, PacifiCorp's IRPs planned to acquire a new thermal resource in about four or five years. As each subsequent IRP was released, the four to five year time period remained constant, but the actual date for the company's planned thermal resource acquisition moved further out in time. For example, in 2005 the next planned thermal resource acquisition was 2010, in 2007 the planned next thermal resource acquisition was 2012, in 2009 the next planned thermal resource acquisition was 2014, etc.

24. The next planned thermal resource acquisition in PacifiCorp's most recent IRPs is now much longer than five years. Specifically, PacifiCorp claims that it will not build a new thermal resource until 2028, which is in 12 or 13 years. Under PacifiCorp's approach, this will result in much longer and historically unprecedented "sufficiency" periods.

25. PacifiCorp's proposal to not make capacity payments until the acquisition of a planned thermal resource acquisition could mean that there will always be a period of resource "sufficiency" and no capacity payments. If the resource sufficiency period is short and the contract term length is limited to five years, projects will receive no or only a year or two of capacity payments. With longer sufficiency periods, as is the case now, projects will no longer receive capacity payments. This means that existing Washington projects that have always received capacity payments will no longer be paid for the capacity they provide to PacifiCorp.

26. Under PacifiCorp's proposal, Washington QFs will not be paid for capacity if they enter into a contract when the next thermal resource acquisition is in six years (2021) or longer. For example, assume that PacifiCorp is planning its next thermal resource acquisition in six years (2021). Under PacifiCorp's proposal, a QF that enters into a new five-year contract in 2015 will not be paid for capacity during the entire contract term. In 2021, PacifiCorp will have a new IRP, which will likely not be planning on a new thermal resource for more than five years, and its new Schedule 37 will not have any capacity payments. If the QF renews its contract and enters into a new five-year contract in 2021, then the QF will again not be paid for capacity. The QF will have caused PacifiCorp to reduce both its energy and capacity needs (including the capacity related to the next planned thermal resource), however, the QF will not be paid for capacity under the company's approach.

27. All QFs provide capacity during all years, including the years before the next acquisition of a new thermal resource. For example, QFs can reduce PacifiCorp's need to re-invest in its coal fleet. In addition, PacifiCorp plans on QFs as capacity resources. In its 2015 IRP, PacifiCorp is planning on the availability of 255 MWs of QFs to meet its system peak. PacifiCorp 2015 IRP at 62. These QFs have been causing, and those that renew their contracts will continue to cause, PacifiCorp to avoid capacity costs.

28. It is particularly inappropriate to not pay QFs that PacifiCorp plans on entering into follow-on contract extensions a full capacity payment. A QF that is seeking renewal and/or extension of its contract should receive a capacity payment because the capacity that it provides has already been included in the utility's IRP load resource balance. In other words, PacifiCorp's IRP assumes these QFs renew their contracts.

Without including these QFs in its resource plans, the company would have would need to acquire new capacity and energy resources.

**B PacifiCorp’s Current Schedule 37 Fails to Fully Compensate QFs**

29. PacifiCorp’s avoided cost rates under compensate QFs because they do not fully account for the potential availability of market purchases. Over the twenty-year planning period, PacifiCorp’s 2015 IRP assumes that it will be able to purchase between 727 and 1,411 MWs from the market, or front office transactions. My understanding is that PacifiCorp has not conducted an analysis in its IRP to determine if there will be sufficient market liquidity to enter into these market purchases. The Northwest Power Planning and Conservation Council has estimated an overall Northwest market shortfall, and PSE’s current IRP is studying the impact of a market shortfall on its operations. The acquisition of electricity from QFs would reduce the need for PacifiCorp to rely upon an uncertain wholesale market. I do not have a specific adjustment to PacifiCorp’s Schedule 37 to compensate for the potential market illiquidity; however, this supports increasing the PacifiCorp’s avoided cost rates to reduce this risk. The Commission could also direct PacifiCorp to develop an adder to the energy or capacity rate to account for the risk reduction associated with QFs.

30. PacifiCorp’s kW per month capacity rate under compensates QFs for capacity because its past approach was based on the fixed costs of simple cycle combustion turbine (“SCCT”) for only three months out of year. This means that only one fourth of the fixed costs of a SCCT have been used to calculate the capacity payment. If PacifiCorp acquires a SCCT peaking resource, then it will incur its fixed costs for all twelve months out of the year. In other words, PacifiCorp is unlikely to acquire a SCCT

for only those months for which it has peak capacity need. Therefore, it is more appropriate to include the full costs of a SCCT in the capacity payment for QFs.

31. PacifiCorp's avoided cost rates also under compensate QFs because they do not account for the costs associated with the company's significant planned investments in environmental upgrades to retain its existing coal facilities. These are actual and planned investments that are not included in the company's current Schedule 37 avoided cost rates. Without these upgrades, PacifiCorp would have to secure a large amount of new capacity and energy resources, thereby significantly reducing its period of resource sufficiency. PacifiCorp has identified a number of environmental upgrades at its existing coal facilities in its 2015 IRP that it plans to make before the acquisition of its next thermal resource, including:

- Hayden 1 SCR by Jun 2015
- Jim Bridger 3 SCR by Dec 2015
- Hayden 2 SCR by Jun 2016
- Jim Bridger 4 SCR by Dec 2016
- Craig 2 SCR by Jan 2018
- Naughton 3 Conversion by Jun 2018
- Craig 1 SCR by Aug 2021
- Hunter 1 SCR by Dec 2021
- Jim Bridger 2 SCR by Dec 2021
- Jim Bridger 1 SCR by Dec 2022
- Colstrip 4 SCR by Dec 2022
- Huntington 1 SCR by Dec 2022
- Colstrip 3 SCR by Dec 2023
- Hunter 3 SCR by Dec 2024
- Cholla 4 Conversion by Jun 2025

2015 IRP, Vol. II at 298-299.

32. Similarly, PacifiCorp's proposed extraordinarily long sufficiency period is sending a price signal to prospective QFs that the long-term value of their capacity is worth very little. At the same time, the Company is facing the challenge of compliance

with EPA's proposed Section 111(d) rules and other greenhouse gas regulations, which propose significant reductions in carbon emissions. The proposed rules are creating significant uncertainty with respect to the Company's long-term resource plan. An important policy question that the Commission should consider is whether it is wise to be signaling to QFs, particularly renewable QFs, that their capacity is of little long-term value, and consequently discouraging their development, at this critical time of changing environmental regulations.

33. In an Oregon Public Utility Commission ("OPUC") investigation into PURPA and QF policies Docket No. UM 1610, the Renewable Energy Coalition and other QF parties have sponsored the testimony of expert witness Kevin Higgins of Energy Strategies. Mr. Higgins estimated the capacity value of only the first six listed environmental upgrades, which resulted in a capacity value of \$47.11 per kW-year. I have attached Mr. Higgins testimony from the OPUC proceeding, which explains how the capacity value with these environmental upgrades was calculated. It would be appropriate to include these capacity costs in PacifiCorp's Schedule 37 rates.

### **Conclusion**

34. PacifiCorp's current Schedule 37 does not fully compensate QFs for the capacity and energy they provide to the company. This is illustrated by the extremely low level of existing QFs and the lack of any interest in QF development in PacifiCorp's Washington service territory.

35. At a minimum, the Commission should retain the current kilowatt month capacity payment in PacifiCorp's Schedule 37. I recommend, however, that the Commission increase the current kW capacity payment. Options to increase the capacity

payment are: 1) including the entire annual fixed costs of a SCCT rather than only three months; and 2) including the costs of PacifiCorp's planned environmental upgrades at its existing coal facilities. The Commission could direct PacifiCorp to make other changes, including a market risk adder to reflect the potential market illiquidity associated with relying upon short-term market purchases.

36. If the Commission does not retain or increase the current kW month capacity payment for all QFs, then REC recommends that the Commission consider other solutions to more accurately compensate QFs. These could include maintaining the capacity payment for already operating QFs that PacifiCorp is relying upon in its IRP, and increasing the contract term for all QFs.

I declare that under the laws of the State of Washington that the foregoing is true and correct. Signed at Portland, Oregon on July 12, 2015.

John R. Lowe

**KEVIN C. HIGGINS**

**ON BEHALF OF**

**RENEWABLE ENERGY COALITION (“REC”),**

**COMMUNITY RENEWABLE ENERGY ASSOCIATION (“CREA”),**

**ONEENERGY and**

**OBSIDIAN RENEWABLES, LLC**

**REDACTED**

**MAY 22, 2015**

1                                   **OPENING TESTIMONY OF KEVIN C. HIGGINS**

2

3    **Introduction**

4    **Q.    Please state your name and business address.**

5    A.           Kevin C. Higgins, 215 South State Street, Suite 200, Salt Lake City, Utah,  
6               84111.

7    **Q.    By whom are you employed and in what capacity?**

8    A.           I am a Principal with Energy Strategies, LLC. Energy Strategies is a  
9               private consulting firm specializing in economic and policy analysis applicable to  
10              energy production, transportation, and consumption.

11   **Q.    On whose behalf are you testifying in this proceeding?**

12   A.           My testimony is being sponsored by the Renewable Energy Coalition  
13              ("REC"), the Community Renewable Energy Association ("CREA"), OneEnergy,  
14              and Obsidian Renewables, LLC ("Joint QF Parties").

15   **Q.    Please describe your professional experience and qualifications.**

16   A.           My academic background is in economics, and I have completed all  
17              coursework and field examinations toward a Ph.D. in Economics at the University  
18              of Utah. In addition, I have served on the adjunct faculties of both the University  
19              of Utah and Westminster College, where I taught undergraduate and graduate  
20              courses in economics. I joined Energy Strategies in 1995, where I assist private  
21              and public sector clients in the areas of energy-related economic and policy  
22              analysis, including evaluation of electric and gas utility rate matters.

1           Prior to joining Energy Strategies, I held policy positions in state and local  
2 government. From 1983 to 1990, I was economist, then assistant director, for the  
3 Utah Energy Office, where I helped develop and implement state energy policy.  
4 From 1991 to 1994, I was chief of staff to the chairman of the Salt Lake County  
5 Commission, where I was responsible for development and implementation of a  
6 broad spectrum of public policy at the local government level.

7 **Q. Have you ever testified before this Commission?**

8 A.           Yes. I have testified in twenty prior proceedings in Oregon, including five  
9 PGE general rate cases, UE 283 (2014), UE 262 (2013), UE 215 (2010), UE 197  
10 (2008) and UE 180 (2006), the PGE Opt-Out case, UE 236 (2012), and the PGE  
11 restructuring proceeding, UE 115 (2001).

12           I have also testified in six PacifiCorp general rate cases, UE 263 (2013),  
13 UE 246 (2012), UE 210 (2009), UE 179 (2006), UE 170 (2005), and UE 147  
14 (2003) and six PacifiCorp Transition Adjustment Mechanism (“TAM”)  
15 proceedings, UE 264 (2014 TAM), UE 245 (2013 TAM), UE 227 (2012 TAM),  
16 UE 216 (2011 TAM), UE 207 (2010 TAM), and UE 199 (2009 TAM), as well as  
17 the PacifiCorp Five-Year Opt-Out case, UE 267 (2013).

18 **Q. Have you testified before utility regulatory commissions in other states?**

19 A.           Yes. I have testified in approximately 180 proceedings on the subjects of  
20 utility rates and regulatory policy before state utility regulators in Alaska,  
21 Arizona, Arkansas, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky,  
22 Michigan, Minnesota, Missouri, Montana, Nevada, New Mexico, New York,  
23 North Carolina, Ohio, Oklahoma, Pennsylvania, South Carolina, Texas, Utah,

1 Virginia, Washington, West Virginia, and Wyoming. I have also prepared  
2 affidavits that have been filed with the Federal Energy Regulatory Commission  
3 and prepared expert reports in state and federal court proceedings involving utility  
4 matters. My involvement in the determination of avoided costs dates back to the  
5 initial Qualifying Facility (“QF”) buyback rates established for the Utah Power &  
6 Light Company in 1984.

7

8 **Overview and Conclusions**

9 **Q. What is the purpose of your opening testimony in this proceeding?**

10 A. My testimony addresses Question 6 in the UM 1610 Phase II Issues List:  
11 “Do the market prices used during the Resource Sufficiency Period sufficiently  
12 compensate for capacity?” I am not testifying regarding any other issues in Phase  
13 II.

14 **Q. Could you briefly explain the Commission’s current implementation scheme  
15 for avoided cost compensation during the Resource Sufficiency Period and  
16 the Resource Deficiency Period?**

17 A. As explained in Order No. 14-058, the Commission requires electric utilities  
18 to set rates based on the cost of a proxy resource during periods of resource  
19 deficiency and on monthly market prices during periods of resource sufficiency. The  
20 Resource Deficiency Period is determined in each utility’s Integrated Resource Plan  
21 (“IRP”) and it is the period for which a deferrable planned resource is identified. The  
22 proxy resource is a natural gas combined-cycle combustion turbine proxy resource  
23 for standard avoided cost prices, and the next avoidable renewable resource identified  
24 in the electric company’s IRP for renewable avoided cost prices. The total fixed costs

1 of the avoided proxy resource are allocated to on- and off-peak prices. Non-standard  
2 avoided cost rates for large QFs are negotiated between the utility and the individual  
3 QF using the standard avoided cost rates as a starting point, with specific guidelines  
4 and methodologies approved by the Commission.<sup>1</sup>

5 In the PacifiCorp service territory, rates for avoided cost purchases for  
6 QFs that are 10 MW or less are presented in Schedule 37, which contains pricing  
7 provisions for both standard avoided cost rates and renewable avoided cost rates.  
8 For Portland General Electric, the analogous rate schedule is Schedule 201, and  
9 for Idaho Power Company, it is Schedule 85.

10 **Q. What is your primary conclusion and recommendation to the Commission on**  
11 **the question of whether market prices used during the Resource Sufficiency**  
12 **Period sufficiently compensate for capacity?**

13 A. I have concluded that the market prices used during the Resource  
14 Sufficiency Period do not sufficiently compensate for capacity in the PacifiCorp  
15 territory. There are two fundamental reasons for this conclusion.

16 The first is that there is a structural problem in the way the PacifiCorp IRP  
17 is interpreted for determining QF pricing. Specifically, in the IRP, small QFs are  
18 presumed to extend their contracts upon expiration – and this very assumption is  
19 then embedded in determining the value of QF capacity, resulting in a logical  
20 circularity. To remedy this problem, the assumption in the IRP that small QFs  
21 extend their contracts upon expiration should be eliminated for the purpose of  
22 determining QF pricing. This would require the development of an Alternative  
23 IRP scenario that re-determined the preferred resource portfolio absent the

---

<sup>1</sup> Order No. 14-058 at 8.

1 (assumed) renewing QFs in order to properly value the capacity that QFs would  
2 avoid. I want to be clear that I am not challenging how PacifiCorp plans for how  
3 QFs renew their contracts, as it is my understanding that most small QFs enter  
4 into PURPA contracts when their current contracts expire. While it is appropriate  
5 to assume that small QFs renew their contracts for *planning* purposes, this is not  
6 an appropriate assumption for QF *pricing*.

7           The second reason is that the extraordinarily long sufficiency period  
8 indicated by the 2015 PacifiCorp IRP is sending a price signal to prospective QFs  
9 that the long-term value of their capacity has no value except for the relatively  
10 small premium that may be included in the price of firm energy based on  
11 projected market prices. This price signal is sent despite the fact that: 1) the  
12 development of rules by the Environmental Protection Agency (“EPA”) under the  
13 auspices of Section 111(d) of the Clean Air Act is creating significant uncertainty  
14 with respect to the Company’s long-term resource plan; and 2) PacifiCorp itself is  
15 planning on a series of significant investments in environmental upgrades to  
16 *retain* its coal capacity. I find this dichotomy to be a source of concern. It strikes  
17 me as unwise to be signaling to QFs, particularly renewable QFs and zero-  
18 emitting QFs, that their capacity is of little long-term value, and consequently  
19 discouraging their development, at a time when new environmental regulations  
20 are placing long-term resource planning in a state of flux. This seems particularly  
21 unwise when it is understood that development of renewable QFs and zero-  
22 emitting QFs is encouraged by the pending environmental rules as a means of  
23 gaining compliance. Meanwhile, far from eschewing investment in capacity as

1 suggested nominally by the designation of a sufficiency period based on the next  
2 deferrable resource in the IRP, PacifiCorp is in reality planning on making  
3 significant investments in capacity *retention* that the Company will ask customers  
4 to pay for.

5 In light of these circumstances, I recommend that the Commission adopt  
6 an interim capacity pricing mechanism for Schedule 37 sales by renewable QFs  
7 and zero-emitting QFs until the uncertainty surrounding implementation of  
8 Section 111(d) is resolved. This approach would be used until the state plans  
9 implementing the Section 111(d) rules are binding upon PacifiCorp. Under this  
10 interim approach, the value of capacity from renewable QFs and zero-emitting  
11 QFs would be determined by the net present value of the revenue requirement  
12 associated with environmental upgrades that are planned for the sufficiency  
13 period. For a renewable QF or zero-emitting QF entering a contract during the  
14 interim period, the capacity value would be added to the energy price until the  
15 pricing in the contract was governed either by the displaceable renewable IRP  
16 resource or displaceable IRP thermal resource, whichever is applicable to that  
17 contract. In other words, this adjustment to the capacity value only applies during  
18 the resource sufficiency period prices.

19 The mechanics for performing this calculation are presented in detail later  
20 in my testimony.

1 **Assumed Renewal of Small QF Contracts**

2 **Q. What does PacifiCorp assume with respect to the continuation of small QF**  
3 **contracts after contract terms expire?**

4 A. According to the 2015 IRP, PacifiCorp assumes that these contracts are  
5 extended when they expire.<sup>2</sup>

6 **Q. Do you have any concerns or objections to this assumption?**

7 A. I do not object to this assumption in the context of the IRP being used in  
8 its traditional role as a planning tool. That is, for *planning* purposes, it is  
9 reasonable to assume these contracts are extended, so as to avoid planning to  
10 construct or acquire duplicative facilities. REC witness John Lowe addresses in  
11 more detail contract renewals by existing QFs.

12 However, it is important to make a distinction when it comes to using the  
13 IRP for *determining QF prices*. In that limited context, it is not reasonable to  
14 assume that small QF contracts are extended when contracts expire because that  
15 assumption produces a logically circular result. That is, when the purpose of the  
16 exercise is to determine the value of QF capacity, the act of assuming that all or a  
17 portion of the QF capacity that is being valued simply “shows up” via contract  
18 extension improperly predetermines the answer to the valuation question – and  
19 will understate the value of the QF capacity.

20 **Q. Do you have a simple example to illustrate this point?**

21 A. Yes. Assume for illustrative purposes that a utility has 300 MW of small  
22 power QF generation selling power under standard fixed avoided cost contracts  
23 and that all of these contracts expire five years from now. For simplicity, further

---

<sup>2</sup> PacifiCorp 2015 IRP, Vol. I, p. 75.

1 assume that front-office transactions are near their planning maximum, load  
2 growth is flat, and there are no planned changes regarding other resources over  
3 the IRP time horizon. Under the assumptions used by PacifiCorp to value QF  
4 capacity, all 300 MW of small power QF capacity will be assumed to extend their  
5 contracts and continue to be in service from Year 6 through the end of the IRP  
6 planning horizon. Under the current method, the IRP would indicate that the  
7 Company was in a sufficiency period throughout the remainder of the time  
8 horizon and that no capacity payment (other than what is attributed to purchases  
9 of firm energy based on projected market prices) was required.

10 Yet it is easy to comprehend that, but for the assumption that small QF  
11 contracts were extended, the utility would require 300 MW of capacity at the end  
12 of Year 5. Properly done, the pricing method should be crediting QFs with the  
13 value of this avoided capacity. This would occur if, for the purpose of  
14 determining the value of QF capacity, the analysis assumed that QF contracts  
15 were not renewed at expiration. But as it is, the method yields no credit to the  
16 QFs for avoiding this capacity due to the logical circularity of the analysis that  
17 assumes that the QFs (whose value the analysis is supposed to determine) are  
18 providing this capacity, effectively for free, through their assumed contract  
19 renewals.

20 **Q. Does the assumption that small QF contracts are renewed upon expiration**  
21 **have a material impact on the valuation of QF capacity?**

22 A. According to PacifiCorp's Response to Data Request REC 8.5,  
23 Confidential Attachment REC 8.5, 122 MW of QF contracts that expire prior to

1 2028 are assumed to be extended in the 2015 IRP. In certain circumstances,  
2 relaxing this assumption could potentially move the deficiency period for thermal  
3 capacity up by a year, perhaps, depending on the amount of capacity attributed to  
4 the renewing QFs and how close front-office transactions are to their maximum  
5 levels. However, relaxing this assumption is not likely to have a material impact  
6 in the current IRP, for which the next thermal resource is strongly driven by the  
7 planned retirement of the Dave Johnson units in 2027, rather than the projected  
8 level of front-office transactions.

9 **Q. What is your recommendation to the Commission on this issue?**

10 A. I recommend that for the limited purpose of determining the capacity  
11 value of QF pricing under Schedule 37, the Commission require PacifiCorp to  
12 identify an Alternative IRP scenario that removes the assumption that small QFs  
13 will extend their contracts upon expiration. This Alternative IRP scenario would  
14 be used to help determine the year of the next deferrable resource for the purpose  
15 of valuing QF capacity.

16 **Q. Are you taking a position on the Phase II issue regarding the appropriate  
17 forum for disputed avoided cost inputs and assumptions?**

18 A. No. My recommendation would apply if the Commission takes up  
19 avoided cost input and assumptions in an expanded IRP process or in an avoided  
20 cost review after the utilities file their avoided cost rates. The analysis regarding  
21 the capacity value of small renewing QFs will be necessary regardless of the  
22 specific forum that the Commission decides to use when addressing the inputs and  
23 assumptions used to set avoided cost rates.

1

2 **Uncertainty Surrounding Compliance with Proposed Section 111(d) Rules**

3 **Q. Please explain your concerns regarding the pricing of QF capacity in the**  
4 **context of the uncertainty surrounding PacifiCorp's compliance with EPA's**  
5 **proposed Section 111(d) rules.**

6 A. Currently, PacifiCorp's Schedule 37 indicates that the sufficiency period  
7 for which no thermal resource deferrals will be recognized in QF capacity prices  
8 extends until the end of 2023, a very long period. The preferred portfolio in the  
9 Company's 2015 IRP indicates that the sufficiency period will extend even  
10 further – until the end of 2027. This extraordinarily long sufficiency period is  
11 sending a price signal to prospective QFs that the long-term value of their  
12 capacity is worth very little. At the same time, the Company is facing the  
13 challenge of compliance with EPA's proposed Section 111(d) rules, which  
14 propose significant reductions in greenhouse gas emissions. The proposed rules  
15 are creating significant uncertainty with respect to the Company's long-term  
16 resource plan. An important policy question that the Commission should consider  
17 is whether it is wise to be signaling to QFs, particularly renewable QFs and zero-  
18 emitting QFs, that their capacity is of little long-term value, and consequently  
19 discouraging their development, at this critical time of changing environmental  
20 regulations. This question is particularly important when it is understood that  
21 development of renewable QFs and zero-emitting QFs are encouraged by the  
22 pending environmental rules as a means of gaining compliance.

23 **Q. Please describe EPA's proposed Section 111(d) rules.**

1 A. EPA's proposed Section 111(d) rules are intended to limit carbon dioxide  
2 emissions from existing power plants. The proposed rules, which are being  
3 promulgated under Section 111(d) of the Clean Air Act, require states to submit a  
4 111(d) compliance plan to the EPA in the 2016 to 2018 timeframe. Subject to  
5 EPA approval of these plans, states will be required to submit interim reports to  
6 the EPA beginning in 2022 to demonstrate interim goals are being met before  
7 achieving full compliance by 2030.

8 In the proposed rule, the EPA identified emission reduction goals for each  
9 state based on its formulation of best system of emission reduction, which is made  
10 up of four building blocks: (1) heat rate improvements at existing coal-fueled  
11 resources; (2) increased utilization of natural gas resources; (3) increased  
12 deployment of renewable resource and zero-emitting resources; and (4) increased  
13 end-use energy efficiency. The EPA applied the four building blocks to the loads  
14 and resources in each state as a whole. Each state may propose how to meet its  
15 goal and is not required to achieve emission reductions in the same manner as that  
16 used by the EPA to calculate the goal.

17 The proposed rule is currently in the midst of a comment period and a  
18 final rule is expected later in 2015. States will be required to submit compliance  
19 plans by 2016, although extensions are possible. The rule is likely to be subject to  
20 extensive litigation.

21 **Q. Does PacifiCorp's 2015 IRP take compliance with Section 111(d) into**  
22 **account?**

1 A. Yes. However, as the rule is not final and is the focus of extensive  
2 commentary and criticism, for planning purposes, compliance planning  
3 necessarily must consider a range of rule outcomes and interpretations. As  
4 PacifiCorp states in its IRP:

5 In this IRP, the Company provides extensive analysis of potential  
6 future resource portfolios under a variety of compliance approaches  
7 to the EPA's proposed Clean Power Plan. However, *significant*  
8 *uncertainty regarding the implementation of this program continues*  
9 *to exist*. Once final, the rule is likely to be subject to litigation, the  
10 outcome of which may not be known for many years. In addition,  
11 the makeup of the final rule and the manner in which states choose  
12 to implement the program will have a significant impact on ultimate  
13 compliance approaches and similarly may not be known for some  
14 years.<sup>3</sup>

15 **Q. How does the uncertainty surrounding implementation of Section 111(d)**  
16 **impact the formulation of the 2015 IRP?**

17 A. To develop a preferred portfolio in the 2015 IRP, PacifiCorp necessarily  
18 had to make certain assumptions regarding implementation of the final rule. For  
19 example, all 2015 IRP cases defined as having a 111(d) emission rate target  
20 assume, for compliance purposes, that the Company can allocate *system*  
21 renewable energy toward meeting emission rate targets in any given state. The  
22 2015 IRP also assumes that a flexible allocation of "111(d) attributes" from  
23 renewable resources is applied to cumulative Class 2 DSM energy efficiency  
24 savings from Idaho and California, where PacifiCorp does not have a 111(d)  
25 compliance obligation. Further, this Company's base case compliance approach  
26 assumes that two distinct attributes (RPS attributes and 111(d) attributes) can be  
27 used for compliance independent of one another. If the final rule permits a

---

<sup>3</sup> Id., Vol. I, p. 28. Emphasis added.

1 flexible allocation of renewable energy and select Class 2 DSM energy efficiency  
2 savings, as well as independence of attributes, as PacifiCorp assumes, the  
3 Company will benefit because this approach does not lead to any incremental  
4 system costs from adding resources for the purpose of meeting 111(d)  
5 requirements and results in the lowest cost compliance action.<sup>4</sup>

6 However, not all versions of the final rule will produce lowest-cost  
7 outcomes for the Company. For example, PacifiCorp has prepared a sensitivity  
8 case S-15, which assumes that state renewable portfolio standard (“RPS”)-eligible  
9 RECs and 111(d) attributes must be surrendered at the same time. As explained  
10 in the 2015 IRP:

11 Linking the Washington RPS program to 111(d) would force  
12 PacifiCorp to meet its share of the state 111(d) emission rate target  
13 with situs assigned renewable resources, or alternatively,  
14 PacifiCorp could eliminate its Washington 111(d) compliance  
15 obligation by retiring Chehalis at the end of 2019. Considering the  
16 low emission rate targets proposed by EPA in its 111(d) rule for  
17 Washington, a significant amount of situs assigned renewables  
18 would be required to offset emissions from Chehalis. For this  
19 sensitivity, PacifiCorp assumes a lower cost alternative *would be to*  
20 *retire Chehalis at the end of 2019*. With this early retirement,  
21 sensitivity case S-15 includes incremental FOTs and DSM  
22 resources, along with a *2020 west side natural gas peaking*  
23 *resource*.<sup>5</sup>

24 Obviously, sensitivity case S-15 produces a different thermal sufficiency  
25 period for QF pricing than does the preferred portfolio. And while PacifiCorp  
26 may advocate for adoption of a final rule that incorporates the flexibility assumed  
27 in the preferred portfolio, the disposition of this issue is yet to be determined.

---

<sup>4</sup> Id., Vol. I, pp. 140, 154.

<sup>5</sup> Id., Vol. I, p. 207. Emphasis added.

1 **Q. What are the implications for Oregon QF pricing of the resource planning**  
2 **uncertainty engendered by 111(d)?**

3 A. With the final rule yet to be decided, and with litigation certain to follow,  
4 the Commission should reflect on whether it is in the public interest to send a  
5 price signal to Oregon QFs that for an extended upcoming period, capacity from  
6 renewable QFs and zero-emitting QFs has virtually no value, particularly since  
7 increased output from renewable resources and zero-emitting resources constitute  
8 one of EPA's four building blocks. In my opinion, in light of these  
9 considerations, it would be reasonable to recognize some capacity value for  
10 renewable QFs and zero-emitting QFs in Schedule 37, at least on an interim basis,  
11 while the uncertainty surrounding the implications of 111(d) on the Company's  
12 resource planning is being sorted out.<sup>6</sup>

13 **Q. On what basis should a capacity value be derived during this interim period?**

14 A. PacifiCorp is planning a series of environmental upgrades to keep its coal  
15 plants operating. These upgrades represent planned investment in capacity  
16 *retention*. As such, the planned expenditures are indicative of the valuation the  
17 Company is placing on capacity during the IRP sufficiency period. I believe it is  
18 reasonable to use the projected per-kW revenue requirement associated with these  
19 investments in capacity retention to value the capacity contribution from  
20 renewable QFs and zero-emitting QFs while the implications from 111(d) are  
21 being determined.

---

<sup>6</sup> While certain resources are both renewable and zero-emitting, others, such as certain hydro resources, may not be classified as "renewable" for purposes of Schedule 37, but are nonetheless zero-emitting. Other resources may be renewable, but are not necessarily zero-emitting. My recommendation is directed to QFs that demonstrate either one of the characteristics of being renewable or zero-emitting (or of course both).

1 **Q. What environmental upgrades is PacifiCorp planning?**

2 A. According to the 2015 IRP,<sup>7</sup> the Company has the following  
3 environmental upgrade projects identified for planning purposes, recognizing that  
4 agency, regulator, and joint owner perspectives on acceptability have not  
5 necessarily been determined:

- 6 • Hayden 1 Selective Catalytic Reduction (“SCR”) by Jun 2015
- 7 • Jim Bridger 3 SCR by Dec 2015
- 8 • Hayden 2 SCR by Jun 2016
- 9 • Jim Bridger 4 SCR by Dec 2016
- 10 • Craig 2 SCR by Jan 2018
- 11 • Naughton 3 Conversion by Jun 2018
- 12 • Craig 1 SCR by Aug 2021
- 13 • Hunter 1 SCR by Dec 2021
- 14 • Jim Bridger 2 SCR by Dec 2021
- 15 • Jim Bridger 1 SCR by Dec 2022
- 16 • Colstrip 4 SCR by Dec 2022
- 17 • Huntington 1 SCR by Dec 2022
- 18 • Colstrip 3 SCR by Dec 2023
- 19 • Hunter 3 SCR by Dec 2024
- 20 • Cholla 4 Conversion by Jun 2025

21 **Q. How can this information be used to derive a capacity value for renewable**  
22 **QFs and zero-emitting QFs during your proposed interim period?**

23 A. The cost information for these projects can be used to calculate the  
24 weighted average per-kW revenue requirement (on a present value basis) for the  
25 portfolio of environmental upgrades that the Company has planned during the  
26 Schedule 37 thermal sufficiency period. This value represents the planned cost of  
27 capacity retention.

28 **Q. How should this value be calculated?**

---

<sup>7</sup> Id., Vol. II, pp. 298-299.

1 A. I have prepared a sample calculation consisting of the first six  
2 environmental upgrades listed above using information provided by PacifiCorp in  
3 its Confidential Response to REC 5.7. For the purpose of determining the  
4 capacity value, I recommend using all of the projects that are identified in the IRP  
5 during the sufficiency period. My sample calculation is summarized in  
6 Confidential Exhibit Joint QF Parties/101. Step 1 of the calculation is to identify  
7 the projected stream of annual revenue requirements for each project. For this  
8 purpose I used an approach that is comparable to what PacifiCorp uses for  
9 determining the revenue requirement of a deferrable thermal plant in calculating  
10 Schedule 37 rates. This stream of revenue requirements is then converted into a  
11 nominal levelized annual value over the remaining Oregon depreciable life of the  
12 facility and expressed on a per-kW basis for each project.<sup>8</sup> A blended capacity  
13 value for the entire portfolio is then determined by taking an average of the  
14 individual project per-kW revenue requirements, weighted by installed capacity.  
15 The blending occurs on a net present value basis, i.e., after discounting the  
16 revenue requirements calculated over disparate time periods to a common starting  
17 date.

18 The resulting per-kW capacity value then can be converted into on-peak  
19 energy prices consistent with the Schedule 37 method. For a renewable QF  
20 entering a contract during the interim period, this capacity component would be  
21 added to the market energy price until the pricing in the contract was governed

---

<sup>8</sup> Conceptually, this is comparable to the nominal levelized prices calculated by PacifiCorp in its Schedule 37 workpapers, except that I am expressing the value on a per-kW basis rather than on a per-MWh basis as PacifiCorp does.

1 either by the displaceable renewable IRP resource or displaceable IRP thermal  
2 resource, whichever is applicable to that contract.

3 **Q. As a reference point, what is the capacity value that results from the sample**  
4 **calculation you performed?**

5 A. The capacity value that results is \$47.00 per kW-year. Using the Schedule  
6 37 method for converting capacity values into on-peak energy charges, this value  
7 translates into an on-peak capacity price of \$10.25/MWH for a baseload resource,  
8 \$0.43/MWH for a wind resource, and \$1.39/MWH for a solar resource, using the  
9 capacity contribution assumptions currently incorporated in Schedule 37. In  
10 using the current Schedule 37 capacity contribution assumptions I am not  
11 endorsing these assumptions, which I understand are being addressed separately.  
12 Also, for purposes of this proceeding, I have treated these prices as confidential  
13 because the underlying projected costs of the individual projects are deemed to be  
14 confidential by the Company. However, I do not believe that a composite  
15 capacity valuation or corresponding composite energy prices should ultimately be  
16 viewed as confidential.

17 **Q. Please summarize your recommendation to the Commission regarding the**  
18 **use of environmental upgrade costs to derive a QF capacity value.**

19 A. I recommend that the Commission adopt an interim capacity pricing  
20 mechanism for renewable QFs and zero-emitting QFs selling power to PacifiCorp  
21 under the Schedule 37 until the uncertainty surrounding implementation of  
22 Section 111(d) is resolved. Under this interim approach, the value of QF capacity  
23 would be determined by the net present value of the revenue requirement

1 associated with environmental upgrades that PacifiCorp is planning for the  
2 sufficiency period. For a renewable QF or zero-emitting QF entering a contract  
3 during the interim period, the capacity value would be added to the market energy  
4 price until the pricing in the contract was governed either by the displaceable  
5 renewable IRP resource or displaceable IRP thermal resource, whichever is  
6 applicable to that contract.

7 **Q. Is your recommendation limited just to PacifiCorp or does it have more**  
8 **general applicability?**

9 A. My proposal is limited to PacifiCorp at this time because of its  
10 extraordinarily extended sufficiency period. However, my recommendation  
11 would have more generic applicability if the sufficiency periods for other utilities  
12 became greatly extended while the uncertainty surrounding implementation of  
13 111(d) remained.

14 **Q. Does this conclude your opening testimony?**

15 A. Yes, it does.

**REDACTED**
